- Timer
- GPIO

Interfacing Peripherals

I/O devices

- “Devices” consist of two parts
 - CPU - to - Device, Device – to - I/O Mechanism
- Example : UART device
 - CPU to/from device via register read/write
 - I/O “mechanism” effectively transparent to CPU

Interfacing Peripherals

- Port-mapped I/O
 - Use special CPU instructions: `Special_instruction Reg, Port`
- Memory-mapped I/O
 - A simpler and more convenient way to interface I/O devices
 - Each device registers is assigned to a memory address in the address space of the microprocessor
 - Use native CPU load/store instructions: `LDR/STR Reg, [Reg, #imm]`

ARM memory-mapped I/O

- Define location(address) for device:

```
.equ DEV1, 0x40010000
```

- Read/write assembly code:

```
LDR    r1,=DEV1    ; set up device address
LDRB   r0,[r1]     ; read byte from DEV1
MOV    r0,#8        ; set up value to write
STRB   r0,[r1]     ; write value to device
```

- Equivalent C code:

```
Var1 = *(char*)DEV1;    // read from DEV1 to variable
*(char*)DEV1 = Var1;    // write variable to DEV1
```

Timer

- Free-run counter (independently of processor)

 - Input capture
 - Output compare
 - Pulse-width modulation (PWM) generation
